Cross ...

If all this is true, then we can figure out the odds of what their offspring will be by using a  $4 \times 4$  Punnett square. We call this a dihybrid cross. There will be 9 genotypes and 4 phenotypes in dihybrid cross offspring.

A commonly discussed Punnett Square is the dihybrid cross. A dihybrid cross tracks two traits. Both parents are heterozygous, and

Read PDF

Biology

one allele for each trait exhibits complete dominance \*. This means that both parents have recessive alleles, but exhibit the dominant phenotype. The phenotype ratio predicted for dihybrid cross is 9:3:3:1.

Primer

The Two Trait Cross  
(Dihybrid Cross)

Mendel continued his  
experimentation

where he looked at  
two traits. These two  
trait crosses are  
called dihybrid  
crosses. While the  
monohybrid cross  
would yield 3:1 ratios  
of the phenotypes, the  
dihybrid crosses
