Canine Parvovirus

Epidemiology In

Bulgaria Sage

Canine parvovirus 2

(CPV-2), the

causative agent of

one of the most

severe diseases in

dogs, was first

identified in 1978

after an epizootic of

gastroenteritis and

myocarditis, and is

Bookmark File

PDF Canine

now occurring worldwide. 17 The investigation of the evolutionary changes suggested

that CPV-2 has originated from a feline panleukopenia-like virus infecting wild carnivores. A few years after its emergence, 2 new antigenic variants,

Bookmark File

Parvovirus is highly contagious and is spread from dog to dog by direct or indirect contact with their feces.

Vaccines can prevent this infection, but mortality can reach 91% in untreated cases. Treatment often involves veterinary hospitalization.

Bookmark File

PDF Canine

Canine parvovirus may infect other mammals including foxes, wolves, cats, and skunks. Felines are susceptible to panleukopenia, a different strain of parvovirus.
