CHAPTER 14 -- CAPACTORS QUESTION & PROBLEM SOLUTIONS 14.1)You have a power supply whose low voltage "ground" terminal is attached to a resistor whose resistance is R = 104ohms. The resistor is attached to a plate (we'll call it plate B) which is next to, but not connected to, a second plate (we'll call it plate A).

Capacitors with different physical characteristics (such as shape and size of their plates) store different amounts of charge for the same applied voltage V across their plates. The capacitance C of a capacitor is defined as the ratio of the maximum charge Q that can be stored in a capacitor to the applied voltage V across its plates. In other words, capacitance is the largest amount of charge ...

For any given magnitude of AC voltage at a given frequency, a capacitor of given size will “conduct” a certain magnitude of AC current. Just as the current through a resistor is a function of the voltage across the resistor and the resistance offered by the resistor, the AC current through a capacitor is a function of the AC voltage across it, and the reactance offered by the capacitor.
