AP Biology Chapter 6: An Introduction to Energy and Enzymes

An enzyme is a biological catalyst, a specific subcategory. Enzymes function by decreasing the activation energy necessary for a reaction to occur. This can be shown in the graph below. As portrayed, the energy associated with reactants and products of the reaction does not change due to the presence of the enzyme.

AP Biology Notes: Enzymes, Metabolism, and Cell Communication Four Things to Know about Enzymes All enzymes possess an active site, a 3-D pocket within their structures, in which substrate molecules can be held in a certain orientation to facilitate a reaction. The two models of enzyme-substrate interaction are lock-and-key and induced fit.
