In the late 1800s, Svante Arrhenius defined an acid as a substance that increases the hydronium ion ( $\text{H}_3\text{O}^+$ ) concentration in water, and a base as any substance that increases the hydroxide ion ( $\text{OH}^-$ ) concentration in water. Acids and bases react with one another in a process called neutralization to form a salt and water. Hydrochloric acid neutralizes potassium hydroxide forming potassium chloride (a salt) and water:

Introduction to Acids and Bases. Acids and bases play a central role in chemistry because, with the exception of redox reactions, every chemical reaction can be classified as an acid-base reaction. Our understanding of chemical reactions as acid-base interactions comes from the wide acceptance of the Lewis definition of acids and bases, which supplanted both the earlier Bronsted-Lowry concept and the first definition--the Arrhenius model.

2 Acids and the hydrogen ion The key to understanding acids (as well as bases and salts) had to await Michael Faraday's mid-nineteenth century discovery that solutions of salts (known as electrolytes) conduct electricity. This implies the existence of charged particles that can migrate under the influence of an electric field.

I. Introduction Acids and Bases have been defined differently and commonly by different scientists throughout hundreds of years. Some of these scientists are Svante Arrhenius, J.N. Bronsted, and T.M. Lowry. Furthermore, Svante Arrhenius proposed that acids and bases have the ability to conduct electricity. When Arrhenius researched this, he determined that in a solution, acidic substances ...

Acids and bases are common in many solutions that exist everywhere, and can be defined by their physical and chemical observations (Table 8.1. 1). Acids and bases in aqueous solutions will conduct electricity because they contain dissolved ions. Therefore, acids and bases are electrolytes. Strong acids and bases will be strong electrolytes.

acids and bases are substances that are capable of splitting off or taking up hydrogen ions, respectively." The Brønsted-Lowry definition broadened the Arrhenius concept of acids and bases. The Brønsted-Lowry definition of acids is very similar to the Arrhenius definition: Any substance that can donate a hydrogen ion is an acid.
