Average kinetic energy of one mole of the gas is equal to $= \frac{3}{2} RT$ Since one mole of the gas contains N_A number of atoms where N_A is the Avogadro number we have $M = N_A m$ $\langle v^2 \rangle = \frac{3}{2} \frac{RT}{M}$ $\langle v^2 \rangle = \frac{3}{2} \frac{RT}{M}$ k_B is Boltzmann constant Average kinetic energy per molecule of the gas is equal to $\frac{3}{2} k_B T$

KINETIC THEORY OF GASES AND THERMODYNAMICS

We said before that the temperature of a substance is a measure of how fast its molecules are moving—or in other words, a measure of the average kinetic energy of the molecules. Well, the kinetic theory of gases lets us relate the kinetic energy of the molecules in a gas to the temperature, volume, and pressure of the gas.

statistical and kinetic theories are outlined prior to thermodynamics, from which we need to borrow a few principal statements. However, one may just as well start with the last chapter, where the basic concept of thermodynamics is outlined, and then proceed to the beginning of the book.

INTRODUCTION TO THERMODYNAMICS AND KINETIC THEORY OF MATTER

The First Law of Thermodynamics is simply a statement of energy conservation as Energy is conserved, and both heat and work are forms of energy Let U be the internal energy of the system; this can include the kinetic energy of the particles, the rotational energy, the chemical potential energy, the electrical energy, and so on.

Difference Between Thermodynamics and Kinetics Similar to the molecular - kinetic theory of gases, thermodynamics is concerned with the analysis of gases. However, while the molecular-kinetic theory of gases studies gas processes with a micro approach, thermodynamics, on the other hand, has a macroscopic approach.

Difference Between Thermodynamics and Kinetics ...

Introduction. In order to connect the macroscopically observed state variables of a gas such as temperature, volume and pressure with the microscopic variables such as particle mass and particle velocity, the kinetic theory of gases was developed. With its help it is possible, for example, to deduce the temperature or the pressure of a gas from the mean kinetic energy of the molecules.

The average kinetic energy of a particle is directly connected to the temperature and independent of the particle mass! Thus the temperature is directly a measure for the average kinetic energy of the gas particles of an ideal gas.

Stephen Blundell's homepage

It was born in the 19th century as scientists were first discovering how to build and operate steam engines. Thermodynamics deals only with the large scale response of a system which we can observe and measure in experiments. Small scale gas interactions are described by the kinetic theory of gases. The methods complement each other; some principles are more easily understood in terms of thermodynamics and some principles are more easily explained by kinetic theory.
