The objective of multiphase flow metering (MFM) is to determine the flow rates of the individual components, for example oil, water and gas. Unfortunately there is no single instrument, which will measure these parameters directly and it is necessary to combine several devices in an instrument package and to calculate the specific flow rates from the combined readings.

In multiphase flow, phases can flow with different average velocities, in which gas typically flows with higher velocities. In this model, for the sake of simplicity but without compromising the...

Do You Understand How Multiphase Flow Meters Works?

Multiphase Flow Meters (MPFM) are devices used to measure the individual oil, water and gas flow rates in a multiphase flow. The term MPFM is used to define also the metering of wet gas streams (i.e. multiphase flow where the gas content is very high). A multiphase flow meter is a device used to measure the individual phase flow rates of constituent phases in a given flow (for example in oil and gas industry) where oil, water and gas mixtures are initially co-mingled together during the oil ...

A multiphase flow meter is a device used to measure the individual phase flow rates of constituent phases in a given flow (for example in oil and gas industry) where oil, water and gas mixtures are initially co-mingled together during the oil production processes.

Multiphase Metering Principles. Operators today are looking for flexible, scalable and accurate multiphase meters that meet field requirements, yet also provide value for money in the most challenging of fields. Through developments in signal processing and field electronics alongside a modular approach, multiphase meters are rising to the challenge, delivering increased flow assurance and production optimization and meeting all field and cost requirements.

Many alternative multiphase metering systems have been developed where the complete multiphase flow is measured using a single multiphase system comprising of a flow meter, especially configured, for multiphase measurements together with associated instruments for measuring specific phase densities, fractions, temperature, pressure, etc.
