Research has shown that a range of adult psychiatric disorders and mental health problems originate at an early age, yet the psychiatric symptoms of an increasing number of children and adolescents are going unrecognized and untreated—there are simply not enough child psychiatric providers to meet this steadily rising demand. It is vital that advanced practice registered nurses (APRNs) and primary care practitioners take active roles in assessing behavioral health presentations and work collaboratively with families and other healthcare professionals to ensure that all children and adolescents receive appropriate treatment. Child and Adolescent Behavioral Health helps APRNs address the mental health needs of this vulnerable population, providing practical guidance on assessment guidelines, intervention and treatment strategies, indications for consultation, collaboration, referral, and more. Now in its second edition, this comprehensive and timely resource has been fully updated to include DSM-5 criteria and the latest guidance on assessing, diagnosing, and treating the most common behavioral health issues facing young people. New and expanded chapters cover topics including eating disorders, bullying and victimization, LGBTQ identity issues, and conducting research with high-risk children and adolescents. Edited and written by a team of accomplished child psychiatric and primary care practitioners, this authoritative volume:
Provides state-of-the-art knowledge about specific psychiatric and behavioral health issues in multiple care settings
Reviews the clinical manifestation and etiology of behavioral disorders, risk and management issues, and implications for practice, research, and education
Offers approaches for interviewing children and adolescents, and strategies for integrating physical and psychiatric screening
Discusses special topics such as legal and ethical issues, cultural influences, the needs of immigrant children, and child and adolescent mental health policy
Features a new companion website containing clinical case studies to apply concepts from the chapters
Designed to specifically address the issues faced by APRNs, Child and Adolescent Behavioral Health is essential reading for nurse practitioners and clinical nurse specialists, particularly those working in family, pediatric, community health, psychiatric, and mental health settings.

Background: Autism spectrum disorders (ASD) are a group of neuro-developmental disorders that are characterized by impaired social interaction, communication, and restricted or repetitive behavior. Children with an ASD also display significant sensory experiences due to sensory disintegration. This integrative review of literature examines the sensory experiences of children with an ASD and determines nursing interventions that will enable them to better cope within the hospital setting. Method: an extensive search of databases and current literature on sensory experiences of children with an ASD and interventions that facilitate coping. Results: Children with an ASD experience a wide range of sensitivity and defensiveness toward stimuli that differs on an individual basis. There is no current research that reflects nursing interventions for children with an ASD, therefore interventions from other heath care occupations were examined and applied to nursing. Conclusion: Further research is needed to better understand sensory defensiveness and research is needed in the area of nursing interventions to enable the best nursing care of children with an ASD.

There is a documented need for caring education regarding patients with autism spectrum disorder (ASD) for nursing students and nursing staff. The autism spectrum population is increasing, one in 59 children in the United States as reported by the CDC ' s Autism and Developmental Disabilities Monitoring (ADDM) Network (as cited in Baio et al., 2018). Nurses are expected to provide appropriate care, showing respect and understanding at all times to both the client and family. Through lack of knowledge and misunderstanding the ASD population has not been given this care. Based on Watson ' s Theory of Caring, an educational ASD caring program was created for a summer session Family Nurse Practitioner assessment class. This educational program provided basic knowledge of ASD and appropriate communication skills for caregivers, guided by caring science concepts. Using the Caring Factor Survey-Care Provider Version, Short Version (CFS-CPV) by Nelson, Thiel, Hozak, and Thomas (2016), and the Autism Knowledge Survey-Revised (AKS-R) by Swiezy, Stuart, and Ashby (2005), student perceived ability to care and student knowledge of ASD were measured. There was a 4.8% and 16% improvement, respectively, from pre- to posttest, but the results are inconclusive due to the small response rate. Nursing curriculums and continuing education offerings should include knowledge related to working with special populations, such as those with communication disorders. Nursing practice guided by caring science principles help nurses to build authentic relationships with patients and families resulting in better health outcomes.

This authoritative resource, now thoroughly revised for DSM-5, has set the standard for the comprehensive assessment of autism spectrum disorder (ASD). Leading experts demonstrate how to craft a scientifically grounded profile of each child’s strengths and difficulties, make a formal diagnosis, and use assessment data to guide individualized intervention in clinical and school settings. Chapters review state-of-the-art instruments and approaches for evaluating specific areas of impairment in ASD and co-occurring emotional and behavioral disorders. Considerations in working with children of different ages are highlighted. With a primary focus on children, several chapters also address assessment of adolescents and adults.

With a rapidly increasing rate of autism spectrum disorder (ASD) diagnoses in the past several years, the need for providers trained specifically in providing routine care to patients with ASD and other behavioral and neurodevelopmental disorders has grown considerably. However, training healthcare professionals in other specialties as well to care for these patients in a variety of settings becomes paramount. Emergency departments (ED) have started to see a rise in ASD patients needing care, though research shows that most medical and nursing schools in the U.S. do not provide the curriculum and training to meet the needs of this population. The current study aimed to examine emergency department nurses’ prior knowledge and experience in taking care of ASD patients and if implementing an educational intervention might increase both competence and confidence in providing future care to these patients in the ED. After presenting an educational intervention discussing ASD and current recommendations for care in the emergency setting, results showed that the nurse participants had increased levels of competence and confidence in their knowledge of the disorder and how to approach the unique challenges that may present during care of the autistic patient.

The Politics of Autism investigates the truths and fictions of public understanding about autism, questioning apparent realities too sensitive or impolitic to challenge. Is there really more autism? How has the count expanded by diagnosing autism over other conditions? Have scientific methods in autism diagnosis gone hand-in-hand with autism increases? Are mild autism cases really a 'disorder,' rather than personality variant? Can autism be quiescent in childhood but truly first recognizable in adulthood? Why does popular media often portray people with autism as odd geniuses ignoring the kind of autism most have? Siegel tackles thorny issues and perennial questions: How do we weigh likely treatment gains with treatment costs? Why does our autism education persist in teaching academic subjects some never master? Why do we fail to plan realistically for autistic adulthood? Which parents get caught up in non-mainstream 'treatments' and fear of vaccines? Readers will see an insider's view of controversies in autism research. Siegel's views, sometimes iconoclastic, always frank and informed, challenge broad unexamined assumptions about our understanding of autism. Each chapter addresses different issues, data, and social policy recommendations. A chapter-by-chapter bibliography with URLs provides both popular media and scientific references.

These 15 standards provide direction for nurses caring for patients with intellectual and developmental disabilities, and represent the current level of knowledge and practice in outcomes identification, planning, coordination, ethics and leadership. Autism Spectrum Disorder (ASD) is a growing health problem and nearly all nurses are likely to care for individuals with ASD. Designed as a textbook and a reference, this volume prepares nurses to recognize the unique challenges of providing evidence-based health care that meets the special needs of ASD patients across the lifespan and in multiple practice settings. Chapters include setting-specific case studies followed by consistently formatted information about key clinical issues, clinical assessment, and best practice nursing plans of care. The book is organized on a social model of disability with a focus on the environmental, cultural, and economic barriers encountered by people with ASD. It highlights the significant role played by nurses in the treatment of ASD patients and helps nurses integrate the specialized information about ASD into their clinical practice. Each section of the book reflects a different life stage and is organized to include learning objectives and developmental needs at the beginning of a section, with key points, a guide to clinical problem solving, and thought-provoking review questions at the end.
Key Features:
Provides evidence-based information for nurses about the special treatment needs of individuals with ASD
Explains how functional deficits of people with ASD complicate health care delivery and how nurses can use this knowledge to provide quality care
Addresses clinical issues across the lifespan and in multiple settings through case studies that illustrate best practice nursing care for a variety of problems
Ideal for continuing education programs, post-master's certificate programs, and school nurse certification programs
