of angiosperms. Even though cross
pollination involves a great deal of pollen
wastage because of its uncertainty more
than 50% of the flowering plants are self
incompatible. The flowering plants
undergo this complex interaction because
the self incompatibility results in genetic
heterogeneity.

Several mechanisms enable the stigma to discriminate between the different types of pollen that it may receive, of which the best studied is self-incompatibility. The molecules that regulate self-incompatibility are well characterized in two plant families, the Solanaceae and Brassicaceae.
