In mathematics, transformation geometry (or transformational geometry) is the name of a mathematical and pedagogic take on the study of geometry by focusing on groups of geometric transformations, and properties that are invariant under them. It is opposed to the classical synthetic geometry approach of Euclidean geometry, that focuses on proving theorems.

Transformation Geometry. Transformations. Transformation means to change. Hence, a geometric transformation would mean to make some changes in any given geometric shape. Types of transformations: Based on how we change a given image, there are five main transformations. 1. Translation happens when we move the image without changing anything in it. Hence the shape, size, and orientation remain the same.
