A visual prosthesis, often referred to as a bionic eye, is an experimental visual device intended to restore functional vision in those suffering from partial or total blindness. Many devices have been developed, usually modeled on the cochlear implant or bionic ear devices, a type of neural prosthesis in use since the mid-1980s. The idea of using electrical current to provide sight dates back to the 18th century, discussed by Benjamin Franklin, Tiberius

Prosthetic Eye: Cost, Care, Surgery, and More
Bionic eye or bionic eye implants or visual prosthesis is an electronic device that provides a sense of eyesight to a visually impaired (partially or completely blind) person. The device is similar to cochlear implants that provide a sense of sound to people who are partially deaf or have problems related to hearing.
